Acknowledgement

Here we gladly present this project report on "PIZZA SHOP MANAGEMENT SYSTEM" as part of 4th semester BCA.

First and foremost, we would like to thank our project Guide, [Komal Shinde Mam], for providing us with guidance and support throughout the project. Their valuable insights and expertise have been instrumental in shaping the direction of our work.

We would like to express our gratitude to our friends and classmates who have supported us throughout the development process. Their encouragement and feedback have been invaluable in refining our ideas and improving our system.

ABSTRACT

The Pizza Shop Management System is a Webpage solution designed to enhance the efficiency of pizza shop operations. It offers a user-friendly interface for customers to place

orders online, customize their pizzas, and make secure payments. For shop owners and employees, the system streamlines order processing, inventory management, and employee scheduling. It also provides insightful reports and analytics for informed decision-making. By

implementing this system, pizza shops can optimize their operations, improve customer experience, and increase overall productivity.

CHAPTER 1

Introduction

Project overview:

The Pizza Shop Management System project aims to develop an automated software solution to streamline operations within a pizza shop. By implementing this system, the project aims to enhance efficiency, reduce costs, and improve the customer experience. Key features include online ordering, order tracking, inventory management, employee scheduling, and data analytics. The project seeks to revolutionize pizza shop operations by providing a user-friendly interface and optimizing workflow processes.

Project Objectives

1. Efficient inventory management.
2. Improved sales and customer relationship management.
3. Implementation of a user-friendly Point of Sale (POS) system.
4. Reporting and analytics for better decision-making.
5. Streamlined employee management.
6. Effective supplier management.
7. Enhanced operational efficiency.
8. Integration with e-commerce platforms.
9. Security and data protection.
10. Scalability and flexibility.

CHAPTER 2

System Analysis

Existing system

The existing system for a pizza shop management system typically includes order management, menu management, inventory management, customer management, and sales reporting.

Disadvantages

1. High initial investment and setup costs.
2. Potential productivity slowdown during the learning curve for staff.
3. Technical issues and system downtime can disrupt operations.
4. Challenges with integrating the new system with existing software or hardware.
5. Dependency on technology increases the risk of disruptions in case of system failures.
6. Resistance from staff members to adopt and adapt to the new system.

Chapter 3

Feasibility study

Technical feasibility

The technical feasibility of a pizza shop management system project involves evaluating factors such as infrastructure, hardware, web development, system integration, scalability, data management and security, mobile accessibility, user interface, and ongoing maintenance and support. Assessing these factors helps determine if the proposed system can be developed and implemented using the available technology and resources.

Economical feasibility

Economic analysis is the most frequently used method for evaluating the effectiveness of a new system . More commonly known as cost / benefit analysis.HTML JS and MySQL database easily available in internet.

Operational feasibility

The project has been developed in such a way that it becomes very easy even for a person with little computer knowledge to operate it . This software is very user friendly and does not require any technical person to operate Thus the project is even operationally feasible .

HARDWARE CONFIGURATION

The section of hardware configuration is an important task related to the software development; insufficient random access memory may adversely affect the speed and efficiency of the entire system. The process should be powerful enough to handle the entire operation. The hard disk should have sufficient capacity to store the file and application.

Processor	: Core i3 and above
Processor speed	: 1.4 GHz Onwards
System memory	: 128 Mb minimum 256 Mb recommended
Cache size	: 512 KB
RAM	: 1 GB(Minimum)
Network card	: Any card can provide a
100mbps speed Network connection	: UTP or Coaxial
cable connection	
Printer	: Inkjet/Laser Color printer provides at least 1000
Dpi	
Hard disk	: 80Gb
Monitor	: SVGA Colour 15"
Mouse	: 104 keys US Key Serial, USB or PS/2
Modem	: 56.6 Kbps

SOFTWARE CONFIGURATION

A major element in building a system is the section of compatible software since the software in the market is experiencing geometric progression. Selected software should be acceptable by the firm and one user as well as it should be feasible for the system.

This document gives a detailed description of the software requirement specification. The study of requirement specification is focused especially on the functioning of the system. It allows the developer or analyst to understand the system, function to be carried out, the performance level to be obtained and corresponding interfaces to be established.

Front end tool	: Visual Studio Code Editor
Backend	: MySQL XAMPP Server
Operating system	: Windows 10
Client Side	: HTML, CSS, JS

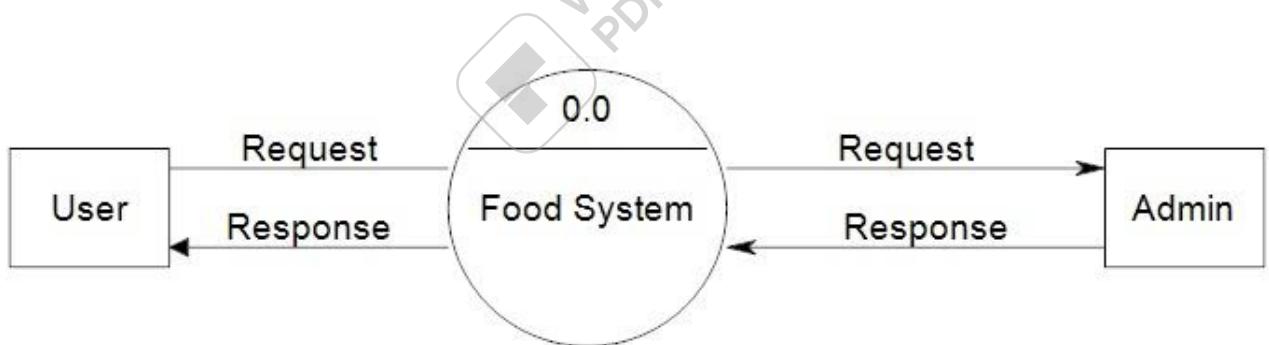

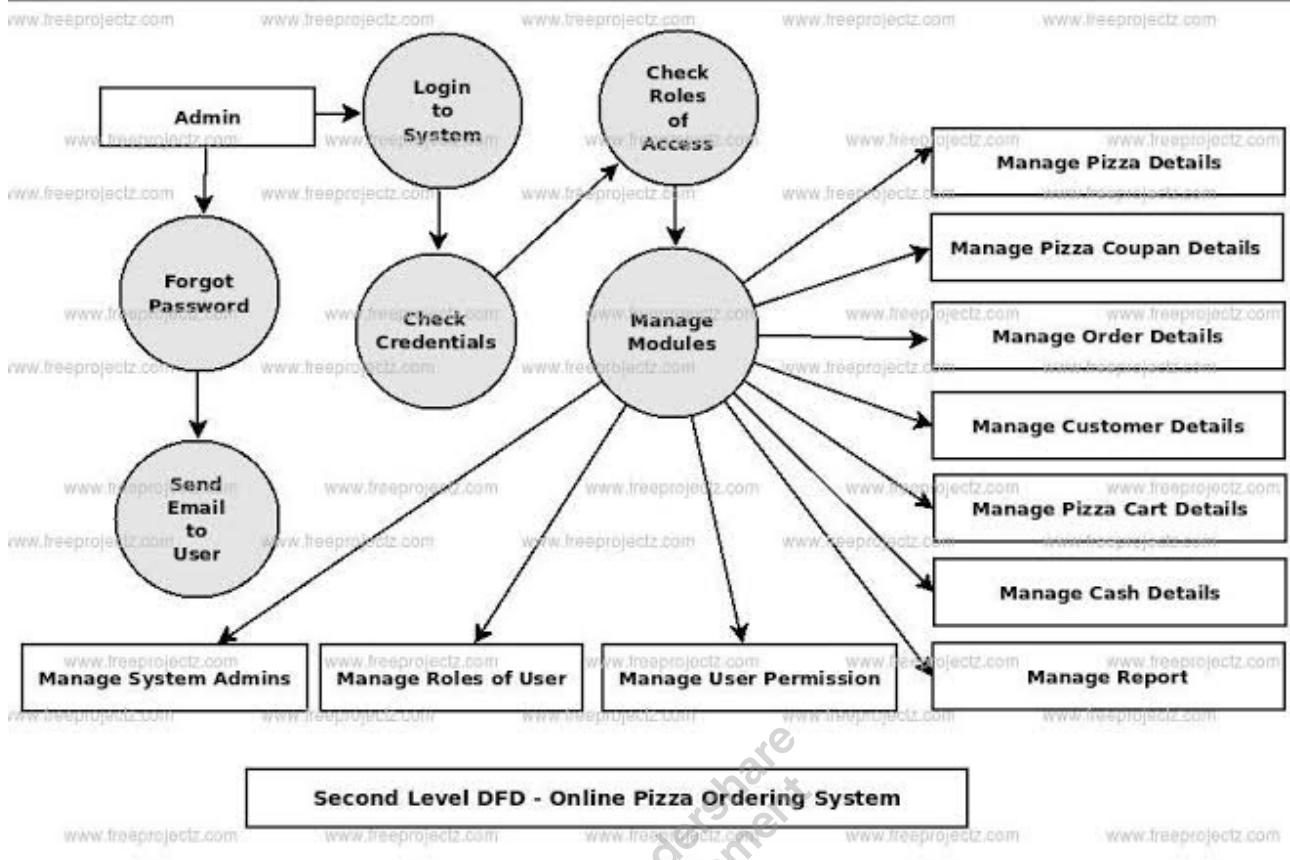

Chapter 4

System Design

The system design for a pizza shop management system project involves designing the overall structure, user interface, modules/components, database schema, data flow, integration with external systems, security measures, reporting and analytics, performance considerations, and error handling. It provides a blueprint for development to ensure a functional and user-friendly system.

Data flow Diagram

Chapter 5

System implementation and Testing

System implementation

System implementation refers to the process of developing and deploying a software system based on the design specifications. Here's a short explanation of system implementation:

System implementation involves translating the system design into a fully functional software system. It includes tasks such as coding, configuring software components, integrating modules, setting up databases, and deploying the system on the target environment. During implementation, developers write and test the code, ensuring that it aligns with the design and meets the specified requirements. The implementation process also involves data migration, system configuration, user training, and documentation. The goal is to successfully transform the design into a working system that can be used by end-users.

Chapter 6

System Testing

System testing is a critical phase in software development that ensures the functionality, performance, and reliability of the system. It typically includes unit testing and integration testing. Here's a short explanation of each:

Unit Testing: Unit testing focuses on testing individual components or units of the software system in isolation. It involves writing test cases for each unit and executing them to verify that the unit functions as intended. Unit tests typically target specific functions, methods, or classes to ensure they produce the expected outputs for a given set of inputs. By isolating units, developers can identify and fix bugs or issues early in the development process.

Integration Testing: Integration testing verifies the interaction and collaboration between different components or modules of the system. It ensures that the integrated units work together as expected and that data flows correctly between them. Integration tests validate the interfaces and communication channels between modules, checking for any errors, compatibility issues, or data inconsistencies. It helps uncover defects that may arise from the integration of different components and ensures the system functions as a cohesive whole.

Both unit testing and integration testing are important for identifying and resolving issues before deploying the system. Unit tests focus on the individual units, while integration tests validate the interactions between these units. Together, these testing approaches contribute to building a reliable and robust software system.

Conclusion

To conclude the description about the project, the project developed using HTML CSS JS and MYSQL Server is based on the requirements specification of the user and the analysis of the existing system with flexibility and enhancement.

In summary, the Pizza Shop Management System project has successfully streamlined the ordering process, improved order management, implemented inventory management, and enhanced customer relationship management. These features have collectively contributed to a more efficient and customer-centric operation of the pizza shop.
